

Setup and everyday commands

File: keep this page open all weekend · **Time:** 45 min at home, before class

1. One-time setup (do this at home)

Open the **Terminal** app and run these, one by one.

```
xcode-select --install
brew install libomp          # needs Homebrew: see SETUP.md if brew is not found
curl -LsSf https://astral.sh/uv/install.sh | sh
```

Now **close the Terminal and open a new one** (so it can find `uv`). Then:

```
git clone https://github.com/balwa/eta-mlops.git
cd eta-mlops
uv python install 3.12
uv sync --extra apple
make all
uv run python verify_stack.py
```

`make all` builds the data and the model. It takes about one minute. The last line of `verify_stack.py` must say:

```
FAILED: nothing – environment ready.
```

Note A `warn` for docker or ollama is okay for Weekend One.

2. Getting the latest version (start of each day)

```
cd eta-mlops
git pull
```

3. Five rules for the weekend

1. **Always work inside the `eta-mlops` folder.** Every command assumes it. Check with `pwd`.
2. **Always put `uv run` in front of `python` and `pytest`.** It uses the course environment.
3. **Never `pip install`.** If something is missing, tell the instructor.
4. **Only one copy of the service.** If you have two copies of the repo, start the service from one only.
5. **Your work goes in the file for that slot.** The test tells you when you are done.

4. Commands you will use again and again

what you want	command
start the ETA service	<code>make serve</code>
is it running?	<code>scripts/serve.sh status</code>
stop it	<code>scripts/serve.sh stop</code>
restart it	<code>scripts/serve.sh restart</code>
see its log	<code>scripts/serve.sh logs</code>
one prediction	<code>scripts/predict.sh R0001</code>
check one slot	<code>uv run pytest tests/test_slot04.py</code>
check all slots	<code>make test</code>
undo a corruption	<code>uv run python -m eta.corrupt restore</code>
make the service re-read the store	<code>curl -s -X POST localhost:8000/reload-store</code>

After `make serve`, this should print `"store_rows":900`:

```
curl -s localhost:8000/health
```

5. If something goes wrong

what you see	what to do
<code>port 8000 is already in use ... NOT starting</code>	Another service is running (maybe from another folder). Run the <code>kill <number></code> it shows, then <code>make serve</code> again.
<code>command not found: uv</code> or <code>brew</code>	Open a new Terminal window and try again.
<code>No such file ... data/...</code>	Run <code>make all</code> .
<code>503 no model</code>	Run <code>make model</code> .
predictions look strange or all the same	<code>uv run python -m eta.corrupt restore</code> , then the <code>reload-store</code> command above.
<code>NotImplementedError</code>	You have not written that function yet. That is expected.
anything else	Copy the whole error and show it to the instructor.
